TP53 and MDM2 feedback loop

MDM2 is an E3 ubiquitin ligase that binds p53 and
targets it for proteasomal degradation.
DNA damage activates ATM, which phosphorylates p53
at Ser15 and disrupts the MDM2-p53 interaction.
This stabilizes p53 and induces CDKN1A (p21).

Method: western blot with anti-p53 antibody (1:1000).
